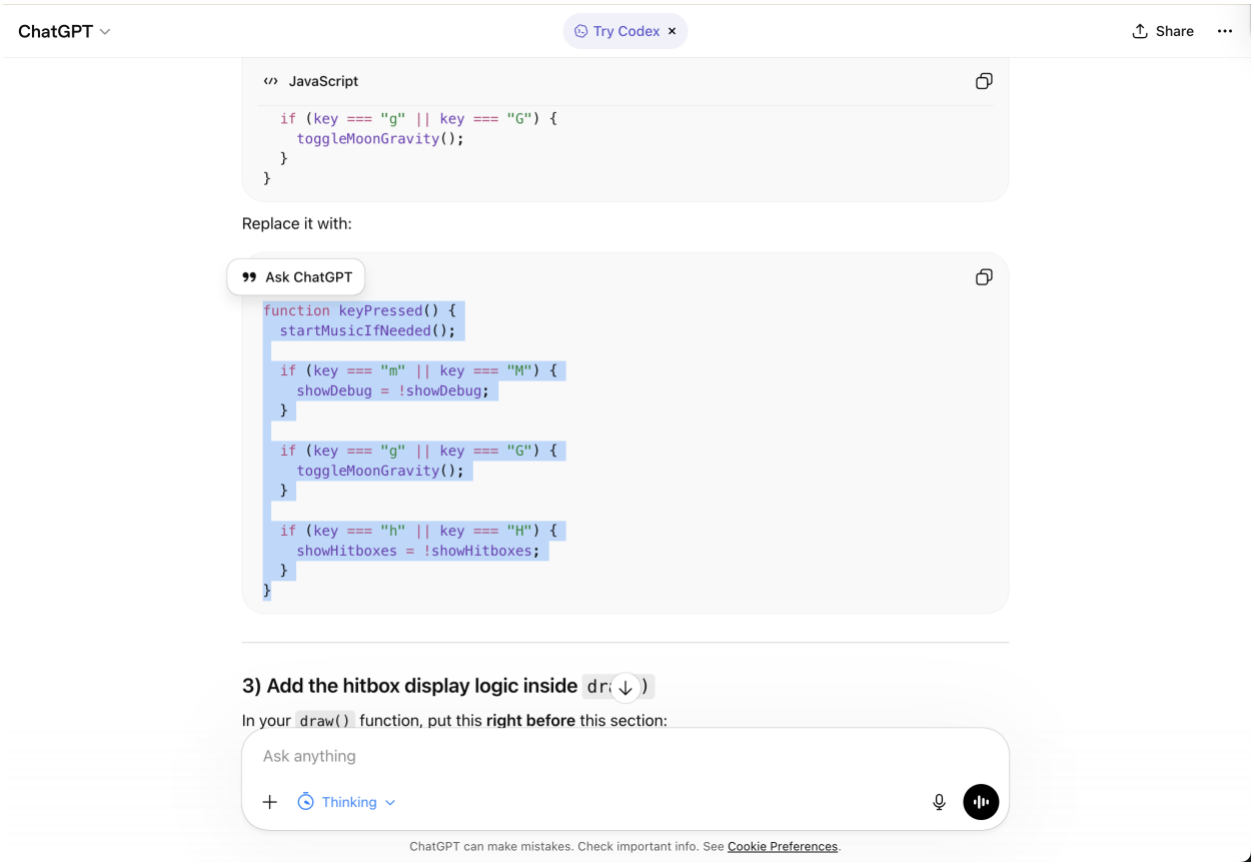
Process & Decision Documentation

Project/Assignment Decisions

Side Quests and A4 (Individual Work)

- Although I had completed the previous side quest (side quest 6), which could have been used for this side quest, I decided to use the example code instead
    - I decided to use this because I wasn't fully successful in completing all of the requirements for side quest 6
    - I also wanted a clean slate to start on
- I also decided to use ChatGPT to write and create code since I have had good experiences and use with it in the past, compared to the built-in Copilot tool in Visual Studio Code

Role-Based Process Evidence



Copying and pasting sections of code from ChatGPT into Visual Studio Code

Goal of Work Session

- Modify example code 3 from week 9 from LEARN to match the side quest requirements
    - Add debug menu
    - Toggle gravity on/off
    - Toggle another feature → visible hitboxes on/off

Tools, Resources, or Inputs Used

- ChatGPT (Thinking)
- LEARN Week 9 Example 3 Code

GenAI Documentation

If GenAI was used (keep each response as brief as possible):

Date Used: March 23, 2026

Tool Disclosure: ChatGPT (Thinking)

Purpose of Use: To change/add to the example code to meet side quest requirements

Summary of Interaction: I input the side quest guidelines within my prompt to get the basic requirements into functioning code. This created a debug menu, and a toggle option for gravity. I then created a prompt that asked for options of other game features that could have a toggle. I chose hitboxes from that list, then asked ChatGPT to implement that toggle feature.

Human Decision Point(s): The initial modification of the debug screen functioned well, however some of the text was overflowing out of the menu box. I had to create an extra prompt to make sure the text stayed within the box. I also decided to have text in the top right corner so that users would know what key to press to open the debug menu.

Integrity & Verification Note: I ran the code after every modification was implemented to make sure it still functioned properly and also to make it easier to troubleshoot if needed since I would know what changes had been made before the code stopped working.

Scope of GenAI Use: I created/wrote all of the prompts that were inputted into ChatGPT. I essentially had to translate the side quest requirements and also additional ideas I had for it, into prompts. I also had to run the code after every modification, then tell the GenAI tools what small mistakes occurred within the code as well as any modifications that needed to be made. (ex, text overflow in the debug menu. GenAI wasn't aware or simply did not say that was an issue. I then needed to create an additional prompt to fix that.)

Limitations or Misfires: I think the GenAI tool missed small details that would help make the user experience more enjoyable/flow smoother. For example, it was not accounted for to let users know what keys to press to open the debug menu. I simply found this out because when I

went to test the code, I didn't know what key to press. The text was also too big/overflowing out of the debug menu after the initial modification from ChatGPT. The code technically functioned properly, however it was hard to read the text, and didn't look nice in general.

Summary of Process (Human + Tool)

- Tested and ran the code after each modification
- Initial prompt had general requirements and overall goal
    - After having a general outline, I was able to go in and modify each section/feature bit by bit
- Told the GenAI tools what changes I made, then prompted it to further process that area of code
    - Ex, pasted in my code and then asked what area I should paste the code ChatGPT outputted

Decision Points & Trade-offs

- Based on previous experiences and outcomes of past side quests, I decided not to use the built-in Copilot tool in Visual Studio Code
- I decided to paste my code into ChatGPT/paste a link to my GitHub repository
    - Although this process is slightly more tedious than using Copilot, the output has worked significantly better

Verification & Judgement

- Ran/tested each modification after I or the GenAI tool modified something
- Referenced the starter example code
    - Ran the starter code to see what it looked like before modifying it
- Referenced the side quest rubric/requirements

Limitations, Dead Ends, or Open Questions

- The debug menu works for what the requirements are for this side quest, but it would have to be redesigned if I wanted to add more toggle options
- Font is slightly hard to read even though it matches the theme of the starter code/overall game theme
- Is there a way to let users know that the menu is opened/closed using the "m" key, without having it be in the top corner at all times?
